

# HOW CAN A SPEECH PATHOLOGIST HELP YOU?

Speech Pathologists study, diagnose and treat people who have difficulty communicating

**People may experience difficulty communicating due to:**

- developmental delays
- stroke
- brain injuries
- learning disability
- Intellectual disability
- Cerebral palsy
- Dementia
- Hearing loss
- Orofacial burns
- Other problems that impact speech and language.

Because we use the same muscles, nerves and structures to speak as we do to eat and drink, people who experience difficulties swallowing food and drinks can also be helped by a speech pathologist.

Speech pathologists also use technological or manual systems to help people communicate when they have difficulty or are unable to say what they want to say.

GRP provides quality Speech Pathology interventions based on the most recent evidence based and goal directed procedures. GRP puts you first and we come to you!

The background of the slide is a solid orange color with a pattern of white, hand-drawn, abstract shapes. These shapes include circles, ovals, and irregular loops, some of which are hollow and some are solid. The shapes are scattered across the entire background, creating a playful and organic texture.
